

CYB 260 Project One Scenario

Fit-vantage Technologies is a quickly growing competitor in the personal fitness-tracking industry. As the company gets closer to launching its newest device, the Flame watch, the Fit-vantage executives have been approached by Helios Health Insurance Inc. to form a partnership. This partnership proposes a program allowing Helios subscribers to purchase a Fit-vantage Flame at a discount in exchange for access to the anonymous data collected from participating customers.

An internal stakeholder board has been formed to determine whether the partnership is in the best interest of Fit-vantage. Discussions at the stakeholder meetings have raised the following questions for consideration:

- What are the concerns around the privacy of customer data, including the data of Helios subscribers and Flame owners who are not part of the Helios program?
- As health insurance companies are considered covered entities under HIPAA, what new legal compliance requirements does this partnership require?
- How profitable will this partnership be? What is the likely effect on the company's value to stockholders?
- What effects will this partnership have on the current customer base?
- How would this partnership align with Fit-vantage's mission and core values?

In this scenario, you will assume the role of an executive-level security consultant with the primary responsibility of advising senior management in cybersecurity matters. Since you are a member of the internal stakeholder board for the proposed partnership, your input is essential. A customer survey and financial outlook have been prepared to help inform your recommendations.

To complete this project, review the following documents:

- Fit-vantage Company Profile, which contains the mission statement, core values, and a draft of the Fit-vantage privacy statement
- Fit-vantage Helios Financial Outlook
- HIPAA Privacy Rule Summary

Links to these documents are on the Project One Milestone Guidelines and Rubric page in the course's Assignment Information area.
