CYB-260: Legal and Human Factors of Cybersecurity

Gareth Marchant

April 16, 2026

Project Three

The service agreement between Helios Health Insurance and Fit-advantage Technologies recommends some control requirements that should be followed to keep the company secure. I also discuss why the benefits of a training program and what the expected results of that program should see.

Recommended Security Controls

The first recommended security control is control number six Access Management. By supporting a standard of least privilege access the company can ensure that only a limited number of authorized users can access sensitive data. By also joining that with something like MFA, or multi factor authentication, users can verify who they say they are and protect from a breach due to the stolen credentials.

The second control that I would recommend is control number 10 Malware defense. This standard sets up procedures to prevent and control the spread of malware into a system. It should also contain an incident response plan of how to deal with malware and breaches if they are detected in the system. This would include a step-by-step playbook for a response team to follow depending on the type of malware or breach detected from the time that it is first discovered to the containment and restoration of the system after the attack has occurred.

Training Program

Having a training program dealing with cyber security issues is a must for any company no matter the size. It should encompass many things and that includes social engineering threats. One of the major threats that most people deal with is phishing emails. These types of emails can sometimes be easy to spot or sometimes they are crafted in a way that makes them hard to spot.

The people receiving these emails and reading them are the first line of defense, a human firewall, against this type of attack. Through reoccurring training and practice people can learn what to look for and the procedures for dealing with a phishing email. Without this protection even the best secured system can be bypassed through leaked credentials, back door or other malware, all of which can be introduced to the system because of a phishing email.

Expected Training Outcomes

Conducting this training should lead to an increase in reporting the of phishing emails and the smaller number of people falling for the suspicious links. A way to measure this would be by sending out test phishing emails to see the results. By making everyone aware of and supporting a culture of cybersecurity awareness a company would be mor likely to stop a data breach before it happens.
